Get consistent results instead of reworking

MICRO burrs with the HICOAT coating increase the tool life and productivity

Consistent, high-quality results are crucial when performing very fine cleaning work or making corrections during tool and mould-making. If the machining process does not deliver consistent quality, this can soon lead to reworking and cost you time.

Consistent quality over the entire period of use

This is precisely where the MICRO burrs from PFERD TOOLS come in. Thanks to their dimensionally stable geometry, they deliver consistent results over the entire period of use. High-quality surfaces are produced and there is less need for reworking.

Better performance thanks to coating

With its HC-FEP HICOAT coating, PFERD TOOLS is now expanding the range to include high-performance variants. The coating significantly improves wear resistance and enables higher cutting speeds – meaning you can machine your workpiece faster without compromising on quality.

Developed for precision applications

MICRO burrs are a reliable solution whenever controlled stock removal and high-quality surfaces are required. The coated MICRO burrs combine a long service life with consistent machining quality and help to make processes more efficient and cost-effective.
